
(a, b) Points: flies (open light, filled dark/DD; faded where not significant); bar: mean; grey: 95% range of the mean without dependence; *: Holm $p < 0.05$; |D| clipped at 1.5.

(c) Mean over flies of each fly's proportion per bin (>= 10 flies), bootstrap 95% intervals; dashed: prediction from the fitted transition matrix, constant in bout length.
