

Points: flies (open light, filled dark/DD). Bar: mean over flies. Grey: 95% range of the mean without dependence (observed: within-fly label permutation; hidden: Markov model simulated and decoded).

*: Holm $p < 0.05$. D = mean ln dur(quiet route) - mean ln dur(active route); $D < 0$: quiet routes go with shorter bouts. Axis clipped at $|D| = 1.8$.
